Note: This document describes the intended project scope. Confirm each feature in the live application before claiming it as implemented.

1. Abstract

CyberAware Campus is a web-based cybersecurity awareness and learning platform intended to help college students recognize common online threats and develop safer digital habits. The project focuses on accessible cybersecurity education through learning modules, fictional scam-identification scenarios, multiple-choice quizzes, and progress tracking. It is built using the Base44 AI app-building platform, with the goal of delivering a responsive and approachable user experience without requiring a complex standalone backend for the initial version.

The platform is educational in nature. It is not presented as a certified antivirus product or a guaranteed real-time scam detection service. Its primary purpose is to teach users how to recognize warning signs, verify suspicious communications through trusted channels, and make safer online decisions.

2. Introduction

Digital services are widely used for education, social networking, shopping, job applications, and payments. Alongside these benefits, users may encounter deceptive messages, phishing attempts, fraudulent job offers, account impersonation, and other social-engineering tactics. Cybersecurity awareness helps users pause, verify, and respond safely.

CyberAware Campus brings introductory cybersecurity topics into one student-friendly web application. Instead of relying only on static articles, it combines short lessons with scenario-based practice and quizzes. This approach is intended to encourage active learning and provide students with feedback about their understanding.

3. Problem Statement

College students increasingly rely on digital platforms but may not have enough practical experience to identify phishing links, fake job offers, suspicious payment requests, social engineering, and attempts to obtain sensitive information. Occasional awareness sessions may not offer continuous practice or a convenient way to assess learning.

Therefore, a web-based platform is proposed to provide structured cybersecurity lessons, fictional scam-identification challenges, knowledge quizzes, and learning progress summaries. The application aims to improve awareness and encourage safer digital behavior.

4. Objectives

• Provide understandable learning material about common cybersecurity threats.

• Help students practice identifying warning signs in fictional messages and offers.

• Assess knowledge through multiple-choice quizzes with explanations.

• Show learning completion and quiz performance where progress storage is implemented.

• Promote safe practices such as protecting OTPs and passwords, checking URLs, and verifying requests through official channels.

• Offer a responsive interface suitable for common desktop and mobile screens.

5. Proposed System and Scope

The proposed system organizes cybersecurity learning in a single web application. Students can browse educational topics, answer scenario questions, complete quizzes, and review their results. Depending on the final implementation, an administrator area may be used to manage learning content and view aggregate learning activity.

Scope for the mini project:

• Cybersecurity learning modules covering phishing, passwords, privacy, job scams, payment safety, and social engineering.

• Fictional scam challenge with classification choices and explanatory feedback.

• Quiz with answer validation, score calculation, and result summary.

• Student progress view if persistent progress tracking is enabled.

• Optional authorized content-management area if supported and tested.

Out of scope for the initial version:

• Guaranteed detection of every real-world scam or malicious URL.

• Antivirus scanning, malware analysis, or penetration testing.

• Collection of real passwords, OTPs, bank credentials, or payment details.

• Unconfigured third-party AI, SMS, email, or threat-intelligence integrations.

6. Main Modules and Features

6.1 Home Page

Introduces the project, presents its tagline, and links to the main learning features and safety information.

6.2 Cyber Learning Hub

Contains concise learning material, warning signs, examples, and safety recommendations for phishing, password protection, social media privacy, fake job offers, digital payment scams, and social engineering.

6.3 Spot the Scam Challenge

Presents fictional messages or offers and asks users to classify them as suspicious or likely legitimate. The application provides feedback and explains the clues. Scenarios should not contain active malicious links.

6.4 Cyber Safety Quiz

Provides multiple-choice questions on cybersecurity fundamentals. The intended workflow includes answer selection, score calculation, explanatory feedback, and a final result summary.

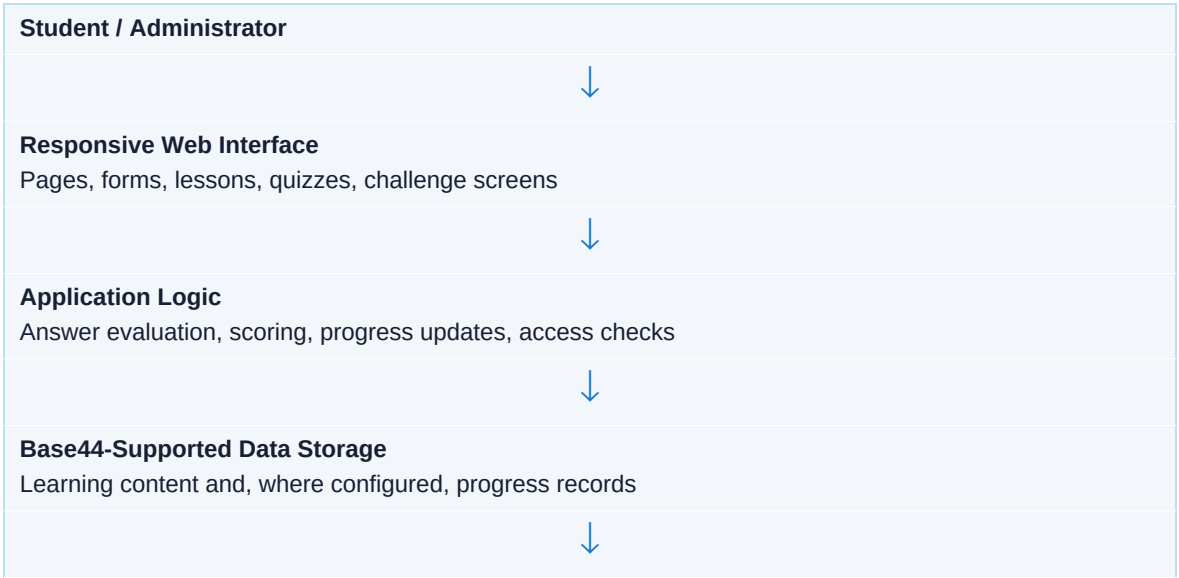
6.5 Student Progress Dashboard

May show completed lessons, recent and best quiz scores, challenge results, and badges. All displayed statistics should come from actual saved records or be clearly marked as demonstration data.

6.6 Admin Dashboard (optional)

If implemented, provides authorized content management and aggregate learning summaries. Administrative operations must be protected by platform-supported access controls.

7. System Architecture



Results and Feedback
Quiz summaries, challenge explanations, progress dashboard

This is a conceptual architecture. Exact storage, authentication, and application-logic details depend on the Base44 configuration used in the deployed project.

8. Technology Stack

Component	Technology / Platform	Purpose
App development	Base44 AI app builder	Generate and configure the web application
User interface	Base44-generated responsive UI	Display pages, forms, lessons, and quizzes
Application logic	Base44-supported logic	Evaluate answers and update results
Data storage	Base44-supported database	Store content and progress where configured
Testing	Manual functional testing	Check workflows, layouts, and permissions

Only list technologies actually used by the deployed application in the final submission. Do not claim a separate framework or API unless it is part of the implementation.

9. Data Model Overview

The following conceptual entities can support the application if persistent storage is configured:

LearningModule — Title, topic, description, learning content, safety tips, publication status.

QuizQuestion — Question text, answer options, correct answer, explanation, topic.

ScamScenario — Scenario title, fictional message, intended classification, explanation, warning signs.

ModuleProgress — Student reference, module reference, completion status, completion date.

QuizAttempt — Student reference, score, total questions, completion date.

ChallengeAttempt — Student reference, score, total scenarios, completion date.

The exact schema should follow Base44's supported data model. Personal progress records should be protected so students cannot access or modify another student's private records.

10. Functional Requirements

• The application should provide navigation between the home page and learning features.

• Learning modules should display educational content clearly.

• The scam challenge should accept a classification and show relevant feedback.

• The quiz should validate answers and calculate a score correctly.

• Progress and scores should persist if database saving is enabled.

• Forms should validate inputs and show useful error or success messages.

• The interface should adapt to mobile and desktop screen sizes.

• Any admin functions should be restricted to authorized users.

11. Security, Privacy, and Limitations

• Use fictional messages and sample identities for educational scenarios.

• Never ask users to submit real passwords, OTPs, bank details, or payment credentials.

• Collect only information necessary for learning features.

• Apply appropriate authentication and data permissions if user accounts and private progress are enabled.

• The platform is educational and does not guarantee that a URL, message, or offer is safe or fraudulent.

• Users should verify suspicious requests using official websites or independently obtained contact details.

A low-risk classification must not be interpreted as proof that a message or website is safe. Real scams may look convincing, and automated or rule-based checks can make mistakes.

12. Testing Plan

Test	Expected result	Status
Navigation	Each link opens the intended page.	To be verified
Learning content	Modules display readable and accurate information.	To be verified
Quiz scoring	Answers produce the expected score and feedback.	To be verified
Scam challenge	Each scenario shows a clear explanation after submission.	To be verified
Progress persistence	Saved progress remains after refresh, if implemented.	To be verified
Responsive layout	Pages remain usable on mobile and desktop.	To be verified
Access control	Private records and admin actions are restricted appropriately.	To be verified

Update the status column after testing the live application. This report does not claim that tests have already passed.

13. Expected Outcomes

• A centralized and accessible cybersecurity learning resource for college students.

• More opportunities to practice identifying suspicious messages and offers.

• A simple way to assess cybersecurity knowledge through quizzes.

• Progress summaries that support self-paced learning, where implemented.

• Improved understanding of safer digital habits and verification practices.

14. Future Enhancements

• Support for Telugu, Hindi, and additional languages.

• Optional AI-assisted analysis of suspicious text with privacy safeguards.

• More scenario-based learning games and topic-specific quizzes.

• Aggregate learning analytics for awareness programs.

• Links to verified cybersecurity education and official incident-reporting resources.

• Accessibility improvements and additional mobile usability testing.

15. Conclusion

CyberAware Campus is a student-focused mini project that uses an interactive web application to make cybersecurity awareness more accessible and practical. By combining learning modules, fictional scam-identification activities, quizzes, and progress tracking, the project aims to help students recognize common online threats and adopt safer digital habits.

The project can be expanded over time with multilingual content, additional scenarios, and optional assisted analysis. Its educational purpose and limitations should remain clear: it supports awareness and learning rather than guaranteeing real-time threat detection.

16. GitHub and Deployment Information

Project title: CyberAware Campus

Live application: https://cyber-campus-guard.base44.app

Development tool: Base44 AI app builder

Repository: Add your GitHub repository URL after creating it.

Project author: Add your name.

Institution: Add your college name.

Department: Computer Science and Engineering

Suggested repository structure

```
CyberAware-Campus/
■■■ README.md
■■■ CyberAware_Campus_Project_Documentation.pdf
■■■ screenshots/
■ ■■■ home-page.png
■ ■■■ learning-hub.png
■ ■■■ scam-challenge.png
■ ■■■ quiz-dashboard.png
■■■ docs/
■■■ project-notes.md
```

GitHub upload checklist

• Replace the name, college, academic year, and repository placeholders.

• Review the live application and remove any features that are not implemented.

• Update the test table with actual results.

• Add screenshots of the deployed application if permitted.

• Upload this PDF and a README.md file to your GitHub repository.

Safer Students • Safer Campus • A Safer Digital Tomorrow
